2025 Rainfall VS 30-Year Average

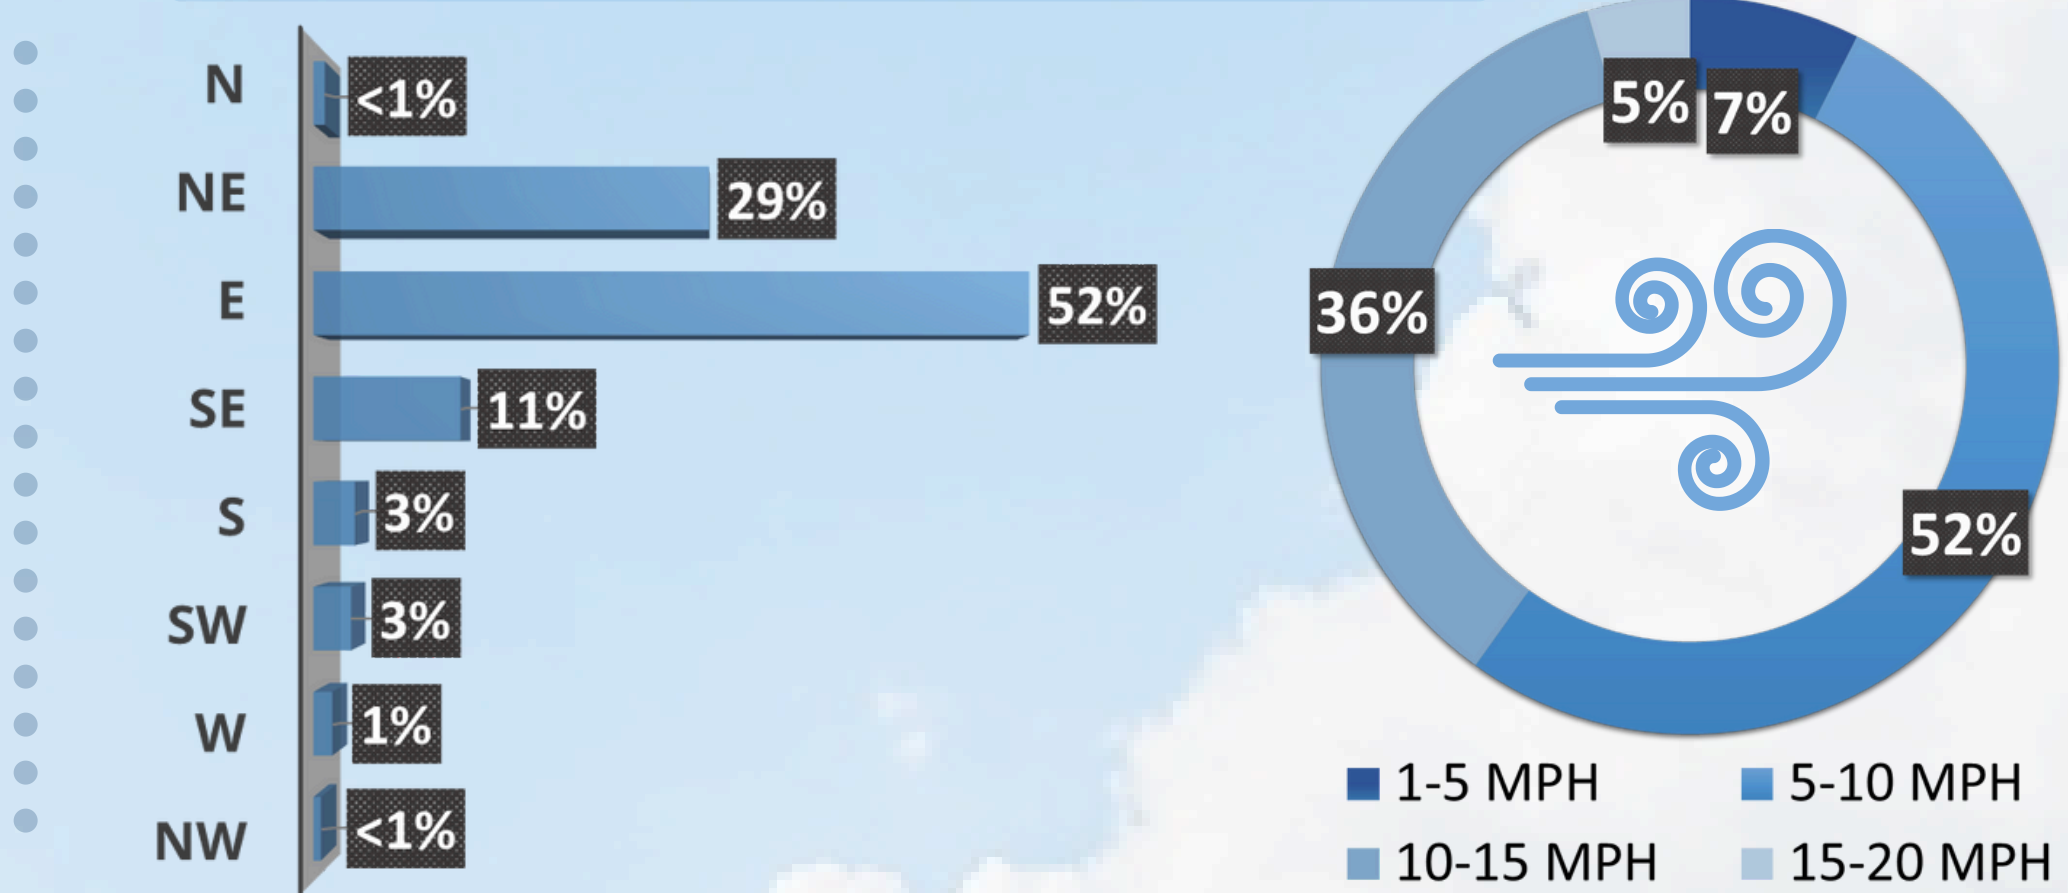

2025 Temperatures VS 30-Year Average Temperatures (°F)

CLOUD COVER

DAILY AVERAGE WIND DIRECTION AND SPEED

HIGHLIGHTS

- Rainfall:** In 2025, totals were well below both recent and long-term averages, making the year one of the driest of the past decade. Annual rainfall was approximately 32 percent below the 2015–2024 average and about 37 percent below the 30-year climatological average. Compared to recent years, 2025 ranked as the driest year within the past 10 years.
- Temperatures:** In 2025, temperatures were well above both recent and long-term averages, placing the year among the warmest of the past decade and continuing the observed warming trend. The annual average temperature was about 0.6°C above the 10-year average and about 1.3°C above the 30-year climatological average. Maximum temperatures were particularly elevated, contributing to increased daytime heat stress, with values averaging about 1.4°C above the 10-year average and about 2.1°C above the 30-year climatological average, ranking as the second highest within the past decade. Minimum temperatures also remained relatively warm, with values about 0.9°C above the 10-year average and about 2.7°C above the 30-year climatological average, ranking fourth warmest for minimum temperatures within the past decade, indicative of reduced nocturnal cooling.
- Outlook:** For 2026, temperatures are expected to remain above-average over the coming months, while rainfall is forecast to be near to below-average, in line with the CINWS Dry Season Prediction.

*30-YEAR AVERAGES ARE FOR THE WMO CLIMATOLOGICAL PERIOD OF 1991-2020
